The invention relates to a method for treating a patient with a chronic condition by administering to the patient at least one daily dose of a cyclodextrin, and to a kit for the performance of such a method. Cyclodextrins have been known for some time. For example, cyclodextrins are employed to form solid dispersions and the like to enhance the bioavailability of certain drugs. Cyclodextrins are also used to form complexation agents for other biologically active substances. U.S. Pat. No. 4,727,064 (Budinoff, et al.) discloses a process for the preparation of a cyclodextrin which involves reacting a cyclodextrin glycoside with ammonia in the presence of sodium hydroxide and then hydrolyzing the product in an aqueous solution of a mineral acid. The basic process of Budinoff, et al. is taught as being useful in the formation of various cyclodextrin-containing products. U.S. Pat. No. 4,936,934 (Leggett) discloses the preparation of a ketoconazole-containing cyclodextrin complex, and this complex is reported to have enhanced solubility in physiologically compatible solvents. However, Leggett does not disclose a cyclodextrin complex which has been prepared from a ketoconazole-containing cyclodextrin complex. U.S. Pat. No. 5,075,121 (Bennett) discloses the use of β -cyclodextrin complexes of various drugs and mentions that they may have increased stability and aqueous solubility. U.S. Pat. No. 5,081,197 (Bennett, et al.) discloses a cyclodextrin complex which is obtained by reacting a β -cyclodextrin complex with an aliphatic amino carboxylic acid. This complex is reported to be useful as a re-constituting agent for pharmaceutical compositions. U.S. Pat. No. 5,194,577 (Bennett, et al 2d92ce491b
