It stands for GNU Image Manipulation Program, and it's perfect for casual use, but professionals use it as well. The name "GIMP" is a nickname for "GNU Image Manipulation Program." Many people confuse GIMP with the GNU operating system and thus take it to mean that it is compatible with many features of the GNU operating system. In fact, GIMP is a standard for 2D and 3D non-destructive editing of raster images. Unlike Photoshop, it uses an editable interface instead of layers and masks, enabling you to edit images quickly and easily. It's even optimized for the Macintosh platform. Thousands of people created artworks with GIMP, enabling it to become a more widely used tool for non-destructive editing of images than Photoshop. Although GIMP is not as advanced as Photoshop, you can take advantage of many of its capabilities. Some of its capabilities include Raster support: GIMP can manipulate raster images (for example, PSDs), as well as vector images (SVG and EPS). Filter support: GIMP filters support a lot of types of pixel filters and can be applied to raster and vector images. Layer support: GIMP supports an unlimited number of layers and you can even create them manually, which is perfect for when you need to use a layer for more than one image at once. Pixel selection: GIMP supports the selection of individual pixels so that you can edit them with existing filters or create your own. Image editing: GIMP supports a lot of popular features, including cropping, resizing, recoloring, and image resampling, as well as performing blending operations. Q: Obtaining the starting position of a Shift-reversed word Given an ASCII string, how would I obtain the starting position of the first word of the string, from which the Shift key is backspaced? For example, if the string was as follows (for which the starting position of the first word would be x): 21_This_Is_A_String. You can assume that the string will not be padded, which means that consecutive spaces will be ignored. I'm aware that the ASCII code of Shift is the ASCII code of Space, but I'm not sure how to relate the two to the actual Shift key that is pressed on the keyboard. To be clear, since the string was typed by holding the Shift key, and since the Shift key on the keyboard is an upper case Space, we only need the ASCII code of a non-Shift character that is common to both the Shift and a Space. A: If you want to assume the shift key is being used as a space, then how about "A?b" instead of "A b"? This would be the most common usage, and so is a solution that will work for everyone... Otherwise, since you'll need to decide on what the "Shift" key is based on, i.e. either function key or actual shift key, it doesn't really matter to us... we could even use the shift key's ascii code... only that way the question wouldn't have been answerable for 99% of the time. Here's a C# example that searches for the starting position of the first space (shift key in this case) of a string of any text, and the number of the character before a word is defined as the starting position. I didn't include a trim of the string as it seems you're asking how to find the starting position of a word that includes spaces. (Edit: I've added trimming to the example) using System.IO; namespace ConsoleApplication1 { class Program { public static int GetWordStart(string MyString) { int startIndex = 0; int startPosition = 0;
