Here are some helpful suggestions: * **Move files to your computer:** From the folder you downloaded or recorded them from, move the files (JPEGs, TIFFs, or other formats) from the camera to the computer. Here's how to do it: * _Connect your camera to a PC or Mac using the supplied USB cable. You must put the memory card in the camera first; then connect the camera to the computer._ * If you do not want to use the memory card, download the images (or see here) to a computer or tablet using either FireWire or Bluetooth. (_Note:_ There are additional methods available as well, so keep your eyes open for other options.) * **Preview images on your computer's screen:** You should do this before you make major changes to your images. In other words, why spend time making changes to files that you won't use later? You'll be glad you did the time-consuming task once you start working with the images in Photoshop. * **Open your images in Photoshop:** Double-click the image on the desktop to open it. If the image is stored in a folder, double-click the image's name. The following tips and tricks should help you get the most from your image: * **Work with one file at a time.** * **Unchecked icons are always on.** They are typically useful if you plan to make changes to the image. 1. Field of the Invention The present invention relates generally to digital media and image processing and, more specifically, to obtaining, processing and analyzing encoded multimedia data. 2. Description of the Related Art The presentation of multimedia data is governed by many factors. The types of media, the equipment used to present the media and the environment in which the presentation takes place all influence the approach taken to present the multimedia data. Multimedia data is typically stored in some form of digital data storage (e.g. hard drives, optical drives, Compact Disks or other types of read and write devices). The data storage device may be a part of some type of data processing system, such as a personal computer. In some circumstances it is desirable to have the multimedia data stored on a server, or some other type of data storage device that is not a part of the data processing system. Multimedia data that is stored on a server is generally downloaded to the data processing system to view or play during a presentation. In some cases, the multimedia data is encoded before being stored so that the data compression of the data is less of a concern. However, encoding the data may use more memory space and be more time consuming than storing the data in its native format. Thus, to save space on the data storage device, before encoding the data, the multimedia data is transformed into a format that takes up less space. There are many encoding schemes used to compress the data; however, some of the more common are MPEG-1, MPEG-2, MPEG-4, JPEG, and GIF. All of these encoding schemes may be encumbered by the respective encoding methodology to achieve different encoding objectives. For example, JPEG encoding is often used for displaying images on the Internet or on static image files that are not intended to be accessed later (i.e. stored). Further, a typical scenario for JPEG encoding is viewing an image file from a file system which is not accessible after the file has been encoded. On the other hand, MPEG encoding is often used to compress multimedia data which is intended to be accessed (i.e. played) later. For example, the typical scenario for MPEG encoding is a playback of some type of encoded media or viewing an encoded media file asynchronously. However, the different types of encoding mechanisms have different complexities. For example, some of the more popular encoded formats take longer to encode than other encoded formats. Thus, depending on the type of device used to play or view the encoded media,

The Hazards of Yoga What is the best way to get in shape, and stay that way? Rather than sit on the couch, watching television and consuming food and carbohydrates, try yoga! The problem with yoga is that you are physically stressing yourself out in a positive manner by stretching certain muscles. If you were to expose yourself to the dangers of yoga, you may find that yoga is much more beneficial to your health. One of the more dangerous physical "achievements" that people think of when they think of yoga, is the actual stretching that is done. Vinyasas are "elastic" stretches that are used to develop strength and flexibility. Quite often, there are people who assume that if they can do a vinyasa, then they will be able to do other stretching exercises in the future. The problem is that the elasticity has the ability to degrade. The elasticity actually begins to slacken when that person's body hits the age of thirty. By the age of thirty five, that person's elastically strength is reduced by about 50%. If you take away the age factor and try to compare the fitness levels of fifty years ago versus the fitness levels of today, then yes, vinyasa work is probably one of the things that is responsible for today's more muscular-looking older people. However, the problem is that those people are taking advantage of the elastically stretching that is done so that they can actually use that body strength for things such as their golf game or their tennis game or their volleyball game! If you are thinking about doing this vinyasa style of yoga, please take heed of what has been mentioned above!Michigan runs into a break in the action with halftime of the game against Indiana State.
